Practical-9

Secure User Registration with Database Insert, Duplicate Email Check, and Password Hashing

Theory

1. Is password_hash() used before storing passwords?

Answer: Yes, password_hash() is used to securely store passwords in hashed form.

2. Is duplicate email/username checked?

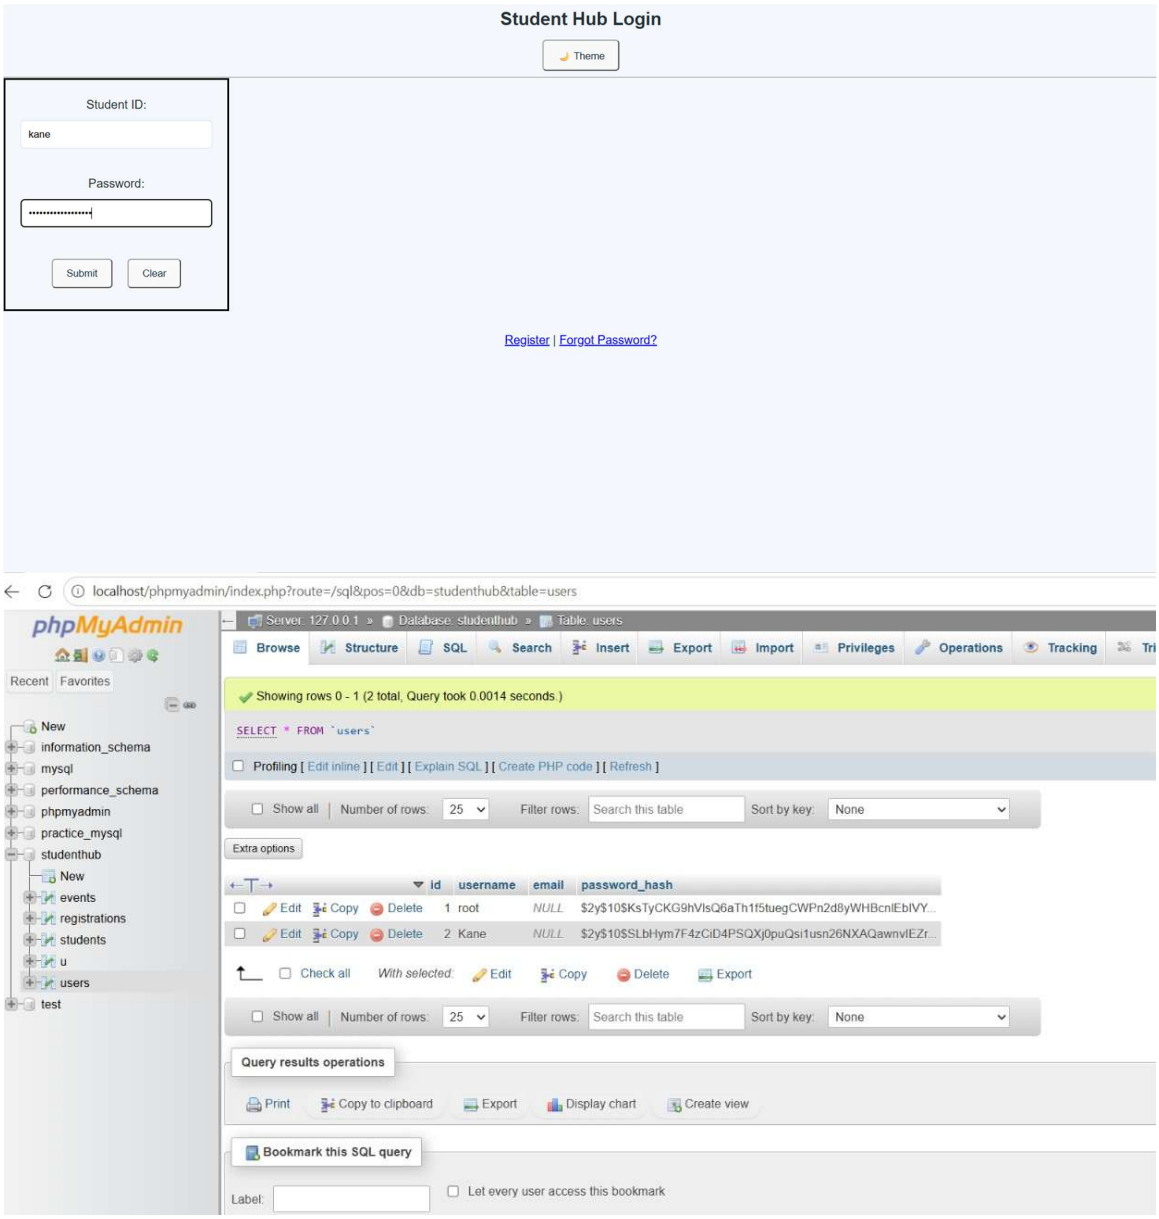

Answer: Yes, duplicate email/username is checked to prevent multiple registrations.

3. Are frontend and backend validations consistent?

Answer: Yes, frontend and backend validations are consistent, ensuring correct and valid user input.

Result:

A. GitHub Repository Link:

https://github.com/krish-301/Student-Hub-Portal

For XAMMP Server Link:-

http://localhost/Student%20port/Pages/login.html

B. Challenges Faced:

Faced difficulties connecting the PHP registration form to the MySQL database.

Had challenges checking duplicate email addresses and usernames.

Learned how to hash passwords instead of storing plain-text passwords.

Faced issues keeping frontend and backend validations consistent.

Had difficulties debugging database insertion errors and displaying proper messages.

Improved understanding of secure coding practices and database operations through troubleshooting.

C.Learning Outcome:-

Implemented secure user registration using PHP and MySQLi with input validation, duplicate email checking, password hashing, and database insertion.
